

SECURITY STANDARDS

Email Authentication Standard (SPF/DKIM/DMARC)

The standard BVTech runs on its own domains and deploys for every client.

Document ID	BVT-STD-246
Version	1.0
Effective date	July 28, 2026
Document owner	Jordan Polasek, Managing Partner
Classification	Internal - BVTech LLC Confidential
Review cycle	Annual, or upon material change

Standard

1. SPF

Exactly one SPF record per domain, ending -all, listing only genuine senders; flattened when lookup limits threaten.

2. DKIM

All outbound mail signed; selectors documented; keys 2048-bit; rotation on provider guidance.

3. DMARC

Exactly one DMARC record; policy quarantine or reject (never long-term none); aggregate reports monitored; subdomain policy explicit.

4. Non-sending domains

Parked domains get SPF '-all', an empty DKIM posture, and DMARC reject so they can't be spoofed.

5. Verification

Authentication posture is checked at onboarding, quarterly, and automatically in the new-client audit.

Compliance

Deviations require a written exception (BVT-FRM-267) with compensating controls and an expiration date. This standard is reviewed annually.
