

Ticket Handling & Service Desk SOP

How every ticket is worked, documented, and closed

Document ID: BVT-INT-065

Version: 1.0

Issued: July 02, 2026

Effective Date: _____

Intake Standards

- Every request becomes a ticket — no shadow work from texts or hallway asks; convert them immediately.
- Triage within SLA response targets (BVT-LGL-003): set priority honestly by business impact, not by who is loudest.
- Verify requester identity for sensitive requests (password resets, data access, user changes) per BVT-OPS-028 — including the emergency verification word for phone requests.
- First response is human and specific: restate the problem, state next step and ETA.

Working Standards

- 1 Document as you go: symptoms, what you checked, what you changed, and why — the next tech (or you, at 2 AM) must be able to continue from your notes.
- 2 One owner per ticket; handoffs include a live or written brief, never a silent reassign.
- 3 Escalate at 50% of resolution target if no clear path (see SLA escalation tiers); escalation is professionalism, not failure.
- 4 Client communication cadence: P1 hourly, P2 every 4 business hours, P3/P4 at meaningful progress and at least daily while active.
- 5 Changes to production follow the mini-change rule: what's the rollback? If you can't answer, stop and plan.

Closure Standards

- Confirm with the user that the issue is resolved (or two documented contact attempts over 48 hours, then resolve with notice).
- Root cause recorded — 'rebooted it' is a workaround, not a cause; recurring workarounds get a problem ticket.
- Time entries accurate same-day; category/type coded correctly (drives reporting and staffing).
- Anything reusable → knowledge base article within 3 days (title = symptom the next person will search).

Quality Loop

Weekly: aging-ticket review (nothing untouched > 3 business days), reopened-ticket review (why?), and CSAT follow-up on negative responses within one business day by the Managing Partner.
