

GuardZ Security Platform — Deployment & Operations Runbook

Standard deployment, monitoring, and response workflow

Document ID: BVT-RUN-055

Version: 1.0

Issued: July 02, 2026

Effective Date: _____

Deployment Checklist (Per Client)

- 1 Create client tenant in the GuardZ MSP console; assign to the correct plan/tier per contract.
- 2 Connect the Microsoft 365 tenant via the API integration (Global Admin consent flow) — verify all security modules show 'connected' and data begins populating within 24 hours.
- 3 Deploy endpoint agents to covered devices via RMM (silent install package); verify device count in console matches RMM inventory.
- 4 Enable modules per contract: email protection, cloud data protection, endpoint security, dark-web/user posture monitoring, awareness/phishing simulation.
- 5 Configure alert routing to the BVTech service desk (email/webhook) with client tag for PSA ticket mapping.
- 6 Baseline pass: review initial posture findings, tune obvious false positives, and record the starting security score for QBR trending.

Daily / Weekly Operations

- Daily: triage new detections by severity; P1 treatment for active-threat indicators (see IRP severity mapping); verify no tenants show 'disconnected' integrations.
- Weekly: review user-risk findings (exposed credentials, risky OAuth apps, MFA gaps) and open remediation tickets; check phishing-simulation results for scheduled campaigns.
- Monthly: export client security posture report; feed score trend and top risks into QBR pack; reconcile licensed seat counts against billing.

Alert Response Mapping

GuardZ Finding Type	BVTech Action
Malware / endpoint threat detection	Isolate per EDR procedure; eradicate; verify with rescan; document in ticket
Compromised / leaked credentials (dark web)	Force password reset + session revocation; check sign-in logs for use; enable/verify MFA; notify client contact
Risky email (phish reported/detected)	Quarantine campaign tenant-wide; block sender/domain; if any user interacted, run BEC playbook (BVT-IRP-047)
Cloud misconfiguration finding	Assess against M365 baseline (BVT-RUN-053); remediate or document client risk-acceptance (BVT-SEC-021)
Shadow IT / unsanctioned app	Review with client; approve + secure, or block and communicate

Escalation & Vendor Support

Platform malfunctions (agents not reporting, integration failures) are ticketed with GuardZ support through the MSP console; capture tenant ID, timestamps, and screenshots. Client-facing impact is communicated per the SLA. Keep the console admin list minimal, MFA-enforced, and reviewed quarterly per the Vendor Risk Policy (BVT-POL-041).
